UX CASE STUDY · 2026

# Arogga Automatic Refill

An automated prescription-refill experience so families managing chronic medication never miss a dose, and never depend on a last-minute phone call.

Conceptual case study · Team Spacing · Case Study Club Bangladesh, Workshop 8.0

### PERSON & ROLE

**Nusrat Zareen — UI/UX Designer**

Team Spacing (5 designers: Sultan M. — lead, Sultana Ayrin Opi, Sourav Bhuiyan, Mostain Billah, Nusrat Zareen). Mentors: Kawsar Mamun, Nayem Islam.

### CLIENT

**Arogga — e-pharmacy, Bangladesh (conceptual brief, 4 weeks)**

### IN ONE LINE

**Before the medicine runs out, the app sends a reminder. The cart is already filled, so one tap places the order.**

---

### PROBLEM UNDERSTANDING

The problem is not ordering medicine. The real problem is knowing a refill is due before it becomes an emergency. Remote caregivers track a parent's chronic medication by memory and phone calls, so the parent usually reports it only after the last pill is gone.

### DESIGN GOAL

Design a flow where a caregiver reorders a parent's monthly medicine in one tap, 3 to 4 days before it runs out, without counting strips by hand and without the app ordering or paying on its own.

### USER PROBLEMS

- Parents call only after the last strip is finished
- Manual pill counting fails: caregivers forget under work pressure, elderly patients forget to keep track
- Remote caregivers feel guilt and panic over distance-driven delays
- Elderly patients find complex app navigation hard to use
- Users will not trust automation that places an order or takes payment without asking first

### DEFINE DESIGN PRINCIPLE

Automate the tracking, keep the human in control. The system predicts the run-out date and prepares the cart, but nothing is ordered or paid without an explicit tap. The caregiver only has to act on the one patient who needs a refill now.

DISCOVERY & RESEARCH

# People don't forget from lack of care. They forget because counting pills by hand every day is hard.

Secondary research on medication adherence, a competitor scan of 4 apps, 13 interviews, and a 43-response survey.

**73.7%**
forget to reorder before the supply runs out

**89.5%**
want a proactive alert before depletion

**63.2%**
ready to use a one-tap ready cart

100% of respondents said managing a distant family member's medication is challenging.

## FROM THE INTERVIEWS

> *"I got caught up in office work and completely forgot. My mother called to say the medicine was finished."*
> Atique Rahman, remote caregiver, 29

> *"At the end of the month I count leftover strips by hand. I have run out of medicine several times doing this."*
> Mahabubur Rahman, retired patient, 60

> *"I don't really understand apps. My daughter orders for me, or I ask someone to bring my medicines."*
> Jakir Hossain, elderly patient, 70

## COMPETITOR SCAN

Every platform we tested handles delivery. None connect daily tracking to a proactive refill.

| Capability | Arogga | Osudpotro | ePharma | DocTime |
|---|---|---|---|---|
| Medication tracking | No | No | No | No |
| Refill reminders | No | No | Partial | No |
| Prescription handling | Partial | Yes | Partial | Yes |
| Delivery | Yes | Yes | Yes | Yes |

Global benchmark: Amazon Subscribe & Save / PillPack — automatic quantity calculation plus scheduled refill.

USER JOURNEY

# Five stages of chronic medicine management

Mapped in FigJam from the interview and survey findings. Every stage carries stress today.

| Stage | Feeling | What breaks |
|---|---|---|
| 1. Realize need | Worried | Counting leftover pills manually is easy to forget |
| 2. Prepare list | Confused | Doctor's handwriting is hard to read |
| 3. Buy | Frustrated | Searching long medicine names one by one is slow |
| 4. Receive | Anxious | Delivery delays create fear of a missed dose |
| 5. Take medicine | Uncertain | Hard to know from far away if the parent actually took it |

## PRIMARY PERSONA

**Atique, 29 — remote caregiver.** Businessman in Dhaka. His mother, Selina Begum (58), lives in Rajshahi and takes 4 daily medicines for diabetes, blood pressure, and acid reflux.

**Goal:** make sure his parents never run out of critical medication without repeated anxious phone calls.

**Frustrations:** forgets reorder dates under office workload; parents call only after the last strip; feels guilty and stressed when emergency orders are delayed.

## PROBLEM STATEMENT

Atique needs a way to automatically track and reorder his parents' medications in one tap from a distance, because work pressure and physical distance frequently delay purchases. Standard pharmacy apps do not help: they require manual searching and never calculate remaining stock or usage rate.

THE SOLUTION

# An uploaded prescription becomes automated peace of mind

The experience was designed to answer, quickly and from a distance:

- ? When will this medicine run out
- ? How many days of stock are left right now
- ? What exactly needs reordering this month
- ? Can I reorder without searching every medicine name
- ? What happens if a medicine is out of stock
- ? Did the order actually go through

### HOW MIGHT WE → FEATURE

| How might we... | Feature |
|---|---|
| warn users before medicine runs out? | **Predictive refill reminders** — tracks daily intake, alerts 3 to 4 days early |
| make remaining home stock easy to see? | **Digital pill-box dashboard** — daily countdown of leftover pills |
| help busy users reorder in seconds? | **One-click automated cart** — past medicines assembled for single-tap checkout |
| assist elderly users who get stuck? | **Direct support call** — one tap to pharmacy support |
| manage medicine for several family members? | **Multi-patient profiles** — separate profiles so doses never mix |
| let users buy only the strips they need? | **Flexible partial purchase** — pick strips or pack counts, not full boxes |

Prioritised with MoSCoW and mind mapping. Scoped for later: prescription update flow, generic stock-out alternatives, caregiver adherence tracking.

### KEY SCREENS

Add Patient · AI Prescription Scan & Review · Digital Pill Box · Medicine Dashboard — Low Stock · Review Order — 1-tap cart · Checkout / Auto Refill · Out-of-Stock alternatives

SCREENS — SETUP

## 01 Add Patient

One profile per family member, so each person's medicine, dosage, and refill schedule stays separate.

**Key sections —** upload photo · name · gender · relationship · age · "add more people anytime" · Add Patient CTA

**Design goal:** make multi-patient tracking possible from the first screen, in under two minutes.

---

## 02 AI Prescription Scan & Review

The caregiver photographs the prescription once. The scan extracts each medicine and the caregiver confirms it, instead of re-reading the whole prescription line by line.

**Key sections —** scanned prescription + retake · extracted medicines list · name, strength, duration · frequency (1+0+1) · before / after meal · initial stock · "Confirmed Match" state · add medicine manually

**Design goal:** let the caregiver trust the scan quickly. Unclear handwriting is flagged for verification; everything else is one tap to confirm.

## 03 Digital Pill Box

The per-patient home for tracked medicine. Every item shows how many days of supply remain, with no manual counting.

**Key sections —** patient header + next refill date · Medicine / Prescription / History tabs · "30 Days Remaining (60 Tabs)" · Good Stock / Low Stock badge · dosage line · Change · Update prescription · Add medicine

**Design goal:** replace hand-counting strips with a glanceable days-remaining view per medicine.

---

## 04 Medicine Dashboard — Low Stock

The alert state. When a patient drops to a few days of supply, the dashboard surfaces it with a single action.

**Key sections —** per-patient card · "4 days of medicine in stock" · "taking 4 medicines daily" · Low Stock badge · Order Now CTA · Add Person

**Design goal:** answer "is a refill due?" in one glance, 3 to 4 days before it becomes urgent.

## 05 Review Order — 1-Tap Cart

"We've prepared this month's refill for Selina Begum." The cart is assembled from past regular medicines. The caregiver reviews and adjusts, rather than searching and adding.

**Key sections —** prepared items list · qty, manufacturer, price · Change to Strips toggle · Add Item · running total · Proceed to Checkout

**Design goal:** cut reorder time to seconds. A ready cart to check, not a form to fill.

---

## 06 Checkout & Out-of-Stock

The confirm gate. Auto Refill is offered as an option, but the order is placed only on an explicit tap. If a medicine is unavailable, alternatives are shown with no pre-selected default.

**Key sections —** Cash on Delivery · Medicine Auto Refill option · order confirmation · out-of-stock alternatives, no default · direct support call

**Design goal:** keep automation trustworthy — nothing is paid without consent, and no dark pattern pushes a substitute.

DESIGN SYSTEM

# Trustworthy, legible, calm

A light-mode system that follows Arogga's existing brand, built for dense medical lists and status badges on a sub-15K Android screen.

## TYPOGRAPHY — INTER

Regular · Medium · Semi Bold · Bold. Clean geometric structure and clear legibility across medicine names, strengths, dosage numbers, and stock badges.

## COLOUR

| Primary | Soft Mint | Amber | White |
|---|---|---|---|
| #0E7673 | #E7F1F1 | #F59E0B | #FFFFFF |

Primary for actions and active state · mint for supporting surfaces · amber for low-stock and warnings. Payment surface supports Cash on Delivery and Medicine Auto Refill.

## SUCCESS METRICS (SET BEFORE DESIGN)

| Metric | Baseline | Target |
|---|---|---|
| Task success rate (complete a refill via the reminder) | 3 of 6 | 6 of 6 |
| Time to complete a reorder | 120 sec | Under 30 sec |
| Refill-date prediction accuracy (user confirms it matched real stock) | 3 of 6 | 5 of 6 |

### KEY UX DECISIONS

- Show **days remaining**, not strip counts, so users never have to do the math
- Next-refill date and countdown are **always visible** on the patient dashboard
- The refill cart is **pre-assembled** from past orders for single-tap checkout
- Auto Refill never orders or takes payment without an **explicit confirm tap**
- **Per-patient profiles** keep multiple family members' medicine fully separate
- Out-of-stock alternatives have **no pre-selected default** and no dark pattern
- The AI scan **flags unclear handwriting** for human verification instead of guessing
- A **direct support call** is one tap away for elderly users who get stuck

### EXPECTED PRODUCT IMPACT

Projected from user-stated demand, not measured outcomes.

- **73.7%** — target reduction in emergency stockouts (share who forget to reorder today)
- **5 min → 10 sec** — reorder time, replacing manual searches with a ready cart
- **89.5%** — surveyed users who want a proactive reminder before depletion
- **100%** — respondents who said managing a distant family member's medicine is hard

**How we would validate this post-launch:** track auto-refill opt-in rate, average stock-days-left at the moment of reorder, and emergency support-call volume over the first 60 days.

### FINAL OUTCOME

- A per-patient tracking dashboard with a days-remaining countdown
- An AI prescription scan with a human review-and-confirm step
- A one-tap refill cart assembled from past orders
- Out-of-stock handling with fair, no-default alternatives
- An Auto Refill option gated by an explicit confirmation

---

**In one statement.** This project shows how a proactive refill layer can turn an anxious, memory-dependent routine into a calm, one-tap monthly task, without ever taking the final decision away from the caregiver.

TEAM & THANKS

# Thank you for reading

Team Spacing — Sultan M. (lead), Sultana Ayrin Opi, Sourav Bhuiyan, Mostain Billah, Nusrat Zareen. Mentored by Kawsar Mamun and Nayem Islam · Case Study Club Bangladesh, Workshop 8.0.
